Milestone 4

What went well. I believe how I planned out the app architecture from the start allowed for easy scaling. I wrote the app using the MVC design principle. I was able to interchange model methods or modify them without them affecting the view undesirably, and the view does not affect the model. What did not go so well is that I wished I incorporated more of my object-oriented knowledge from my previous classes, creating a class/activity diagram to plan out the design of the classes. I found myself continually modifying my model methods to account for more things. Instead, what I would do differently is to follow more object-oriented design principles and make the model more open for extension and less for modification.
